AMENDMENTS TO THE SPECIFICATION:

Please replace the paragraph bridging pages 6 and 7 of the specification with the following paragraph:

Furthermore, the vibrator 4 including the pair of vibrating bodies 3 arranged so as to be opposite to each other is constructed such that the entire device can make a secondary bending vibration with both ends free-movable in the thickness direction Y of the vibrating bodies 3. More specifically, of the three nodal points of the secondary ~~vending-bending~~ vibration existing along the longitudinal direction X, the vicinities of the nodal points located at both end portions are supported by a pair of conductive supporting parts 10 having spring action, that is, a total of four supporting parts 10. The resonance frequency of the secondary bending vibration is close to the frequency of the buckling vibration.
